Here is a little preview of the upcoming feature on Speedwing Mechanics and Speedwing Design Basics....

By understanding the basics mechanics of a speedwing you will be able to better predict the positive or negative effects any input / change in parameters has.

Be it the carabiner distance of your harness or be it a very heavy or a very light pilot, a heavy backpack or freeride boots and skis... all has an effect on how your wing flies, and the smaller the wing and the higher the wingload the more substancial and more noticable *(and sometimes even dangerous)*
these effects will be.
